

Jurisdiction-Specific IIS Data Points

Use this tool to develop data points about the information in the IIS and how the information is collected and used. Having data points will be impactful when speaking to the value of the IIS and why data exchange with Medicaid and other stakeholders is essential.

These are just a few examples of impactful data points to collect and use when developing talking points and using the other tools within the communications toolkit. Work with your IIS Manager to collect this information. The CDC has an [IIS Data Quality Dashboard](#) available for each jurisdiction populated by the most recent IIS Annual Report (IISAR). The information in the dashboard can be used to supplement the information collected below.

The [jurisdiction IIS] contains:

- X # of unique immunizations
- X # of unique individuals
- Total # active connections to the IIS
- # of connections with a one-way exchange (either reporting to or receiving data from the IIS but not both)
- # of connections with a bi-directional exchange (reports to and receives immunization histories from the IIS)

Consent Policy [example from [Alabama CDC IIS Dashboard](#)]

- **Adult consent:** Adult Medicaid recipients are included in the IIS with no possibility to opt-out. All other adults are included in the IIS unless they choose to opt-out.
- **Child consent:** Child Medicaid recipients are included in the IIS with no possibility for their parent(s)/guardian(s) to opt them out. All other children are included in the IIS unless their parent(s)/guardian(s) choose to opt them out.

Medicaid-specific Information

- # of individuals in the IIS with a patient-level eligibility of “Medicaid-eligible.”
- # of immunizations administered with a dose-level eligibility of “Medicaid-eligible.”
